## PROJECT CALENDER

Phase	Phase Description	Week	Dates	Activity Details
1	Preparation Phase (Pre-requisites, Registrations, Environment Set-up, etc.)	2	22 - 27 Aug 2022	Creation GitHub account & collaborate withProject repository in project workspace
2	Ideation Phase (Literature Survey, Empathize, Defining Problem Statement, Ideation)	2	29 Aug – 3rd Sept 2022	Literature survey (Aim, objective, problem statement and need for the project)
		3	5 - 10th Sept 2022	Preparing Empathy Map Canvas to capture theuser Pains & Gains
		4	12 - 17 Sept 2022	Listing of the ideas using brainstorming session
3	Project Design Phase -I (ProposedSolution, Problem- Solution Fit, Solution Architecture)	5	19 - 24 Sept 2022	Preparing the proposed solution document
		6	26 Sept - 01 Oct 2022	Preparing problem - solution fit document &Solution Architecture
4	Project Design Phase -II (Requirement Analysis, CustomerJourney, Data Flow Diagrams, Technology Architecture)	7	3 - 8 Oct 2022	Preparing the customer journey maps
		8	10 - 15 Oct 2022	Preparing the Functional Requirement Document & Data- Flow Diagrams and TechnologyArchitecture
5	Project Planning Phase (Milestones & Tasks, Sprint Schedules )	9	17 - 22 Oct 2022	Preparing Milestone & Activity List, SprintDelivery Plan
6	Project Development Phase (Coding & Solutioning, acceptance Testing, Performance Testing)	10	24 - 29 Oct 2022	Preparing Project Development - Delivery of Sprint-1
		11	31 Oct - 5 Nov 2022	Preparing Project Development - Delivery ofSprint-2
		12	7 - 12 Nov 2022	Preparing Project Development - Delivery ofSprint-3
		13	14 - 19 Nov 2022	Preparing Project Development - Delivery of Sprint-4

# **CHAPTER 1**

## **INTRODUCTION**

### **1.1 PROJECT OVERVIEW**

The problem faced by the retailers is that they do not have any system to record and keep their inventory data. It is difficult for the owner to record the inventory data quickly and safely because they only keep it in the logbook and not properly organized.

Inventory management facilitates the smooth functioning of your business and enhances sales, promotes cost-effectiveness, and improves customer experience. Listed below are some of the reasons why businesses need inventory management:

- Managing Finances
- Tracking Inventory
- Avoiding late deliveries
- Managing time and effort
- Predicting future sales
- Enhancing customer loyalty

### **1.2 PURPOSE**

Retail inventory management is the process of ensuring retailers meet customer demand without running out of stock or carrying excess supply. The objective of the project is to create an application that help retailers to track and manage stocks which results in lower costs and a better understanding of sales pattern. By creating an application, retailers can log in to it and can update inventory details, also users will be able to add new stock by submitting essential details related to the stock. Retailers can also view details of the current inventory. The System will automatically send an email alert to the retailers if there is no stock found in their accounts. So that they can order new stock.

## **CHAPTER 2**

### **LITERATURE SURVEY**

#### **2.1 EXISTING SOLUTION**

In recent years, the correct management of inventories has become a fundamental pillar for achieving success in enterprises. Unfortunately, studies suggesting the investment and adoption of advanced inventory management and control systems are not easy to find. In this context, this article aims to analyze and present an extensive literature concerning inventory management, containing multiple definitions and fundamental concepts for the retail sector. A systematic literature review was carried out to determine the main trends and indicators of inventory management in Small and Medium-sized Enterprises (SMEs). This focus specifically on the retail sector. The primary outcomes of this study are the leading inventory management systems and models, the Key Performance Indicators (KPIs) for their correct management, and the benefits and challenges for choosing or adopting an efficient inventory control and management system. Findings indicate that SMEs do not invest resources in sophisticated systems; instead, a simple Enterprise Resource Planning (ERP) system or even programs such as Excel or manual inventories are mainly used.

#### **2.2 PROBLEM STATEMENT DEFINITION**

The problem faced by the retailers is that they do not have any system to record and keep their inventory data. It is difficult for the owner to record the inventory data quickly and safely because they only keep it in the logbook and not properly organized.

## CHAPTER 3

### IDEATION AND PROPOSED SOLUTION

#### 3.1 EMPATHY MAP CANVAS

An empathy map is a collaborative visualization used to express clearly what one knows about a particular type of user. It externalizes knowledge about users in order to create a shared understanding of user needs, and aid in decision making.

Empathy maps are split into 4 quadrants (Says, Thinks, Does, and Feels), with the user in the middle. Empathy maps provide a glance into who a user is as a whole. The *Says* quadrant contains what the user says or what he needs. The *Thinks* quadrant captures what the user is thinking throughout the experience. The *Does* quadrant encloses the actions the user takes. The *Feels* quadrant is the user's emotional state.

The empathy map for Inventory management system for retailers is shown in Fig 3.1

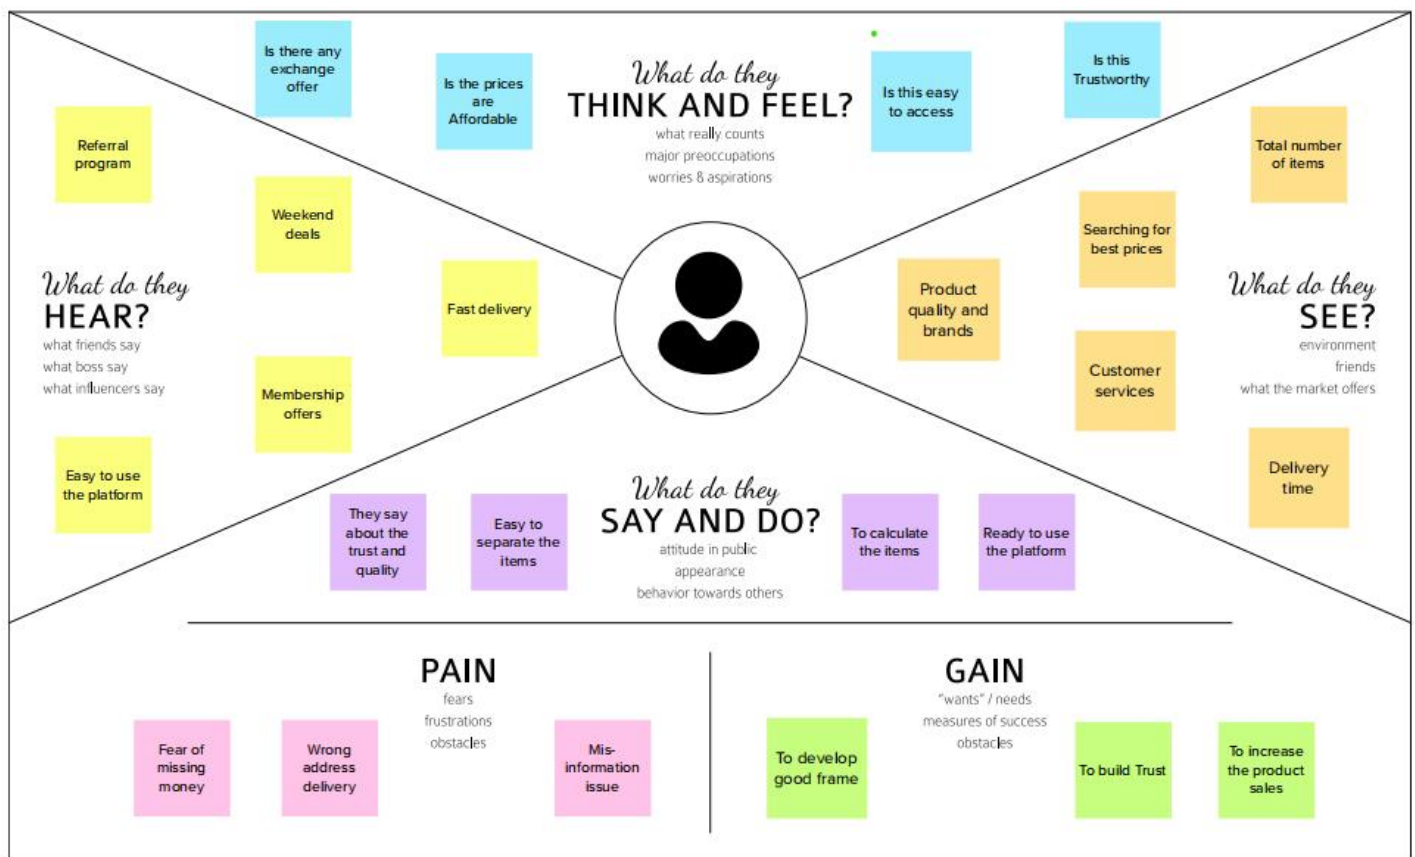

Fig 3.1 Empathy map

### 3.2 IDEATION AND BRAINSTORMING

Ideation is often closely related to the practice of brainstorming, a specific technique that is utilized to generate new ideas. Brainstorming is usually conducted by getting a group of people together to come up with either general new ideas or ideas for solving a specific problem or dealing with a specific situation. A principal difference between ideation and brainstorming is that ideation is commonly more thought of as being an individual pursuit, while brainstorming is almost always a group activity. Both brainstorming and ideation are processes invented to create new valuable ideas, perspectives, concepts and insights, and both are methods for envisioning new frameworks and systemic problem solving.

The Ideation chart for Inventory management system for retailers is shown in Table 3.2.

Tracking the quality	Store a products based quality	Analyse the defects	Evaluate the quantity
Maintain the security	Detection of defect products	Monitoring storage	Offer provide
Issues recovery	Information maintenance	Monthly updation	Warranty of product
Proper communication with customers	Earn some ratings	Bag the customer trust	Advertise the banner

**Table 3.2 Ideation and Brainstorming**

### 3.3 PROPOSED SOLUTION

The proposed solution for Inventory management system for retailers is shown in table 3.3

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	When there is no proper system to track products, materials, or equipment in the store, it can be cumbersome and time-consuming to find them when you have sales orders.
2.	Idea / Solution description	All products that you have should be tagged with RFID, Barcodes, or QR codes etched with a laser.
3.	Novelty / Uniqueness	Well managed stocks leads to more efficient and organized warehouses.
4.	Social Impact / Customer Satisfaction	<ul style="list-style-type: none"><li>✓ User friendly interface</li><li>✓ Accurate and easy product search.</li><li>✓ Deals with customer queries.</li></ul>
5.	Business Model (Revenue Model)	<ul style="list-style-type: none"><li>✓ Reliable database</li><li>✓ Secure database</li><li>✓ Easy-to-use interface</li></ul>
6.	Scalability of the Solution	<ul style="list-style-type: none"><li>✓ Forecasting demand</li><li>✓ Measure Service Level</li><li>✓ Transparent Performs</li></ul>

**Table 3.3 Proposed Solution**

### 3.4 PROBLEM SOLUTION FIT

The Problem solution fit simply means that one have found a problem with the customer and that the solution one have realised for it actually solves the customers problem. The problem solution fit is an important step towards the Product-Market Fit. The structure of problem solution fit is given below.

**Customer state fit:** To make sure one understands the target group, their limitations and their currently available solutions, against which one is going to compete.

**Problem-Behavior fit:** To help one to identify the most urgent and frequent problems, understand the real reasons behind them and see which behavior supports it.

**Communication-Channel fit:** To help one to sharpen the communication with strong triggers, emotional messaging and reaching customers via the right channels.

**Solution guess:** Translate all the validated data one have gathered into a solution that fits the customer state and his/her limitations, solves a real problem and taps into the common behavior of the target group. The below fig 3.4 shows the problem solution fit

<b>1. CUSTOMER SEGMENT(S)</b> <span>CS</span> Define CS, fit into CL The person searching for a product to purchase on an online shopping site	<b>6. CUSTOMER LIMITATIONS</b> <span>CL</span> <small>EG. BUDGET, DEVICES</small> • Lack of time • Unsatisfiable Search results • Navigation among Screens	<b>5. AVAILABLE SOLUTIONS</b> <span>AS</span> <small>PLUSES &amp; MINUSES</small> Explore AS, differentiate • User-Friendly Platform • Enabling Notifications for new products and offers
<b>2. PROBLEMS / PAINS</b> <span>PR</span> <small>+ ITS FREQUENCY</small> Focus on PR, Map into BE, understand BC • Inconsistent Tracking • Problem Stock • Product Mismatched • Changing Demand • Inaccurate Data	<b>9. PROBLEM ROOT / CAUSE</b> <span>RC</span> • Wrong material being procured • Quality related issues • Data entry errors • Forecasting errors • Communication gaps	<b>7. BEHAVIOR</b> <span>BE</span> <small>+ ITS INTENSITY</small> Focus on BE, Map into BC, understand BC • Move towards offline shopping • Look for a Better shopping site • Their choice may change
<b>3. TRIGGERS TO ACT</b> <span>TR</span> Identify strong TR & EM • Shopping in hand • Cost and time efficient • New Updation <b>4. EMOTIONS</b> <span>EM</span> <small>BEFORE / AFTER</small> Before : Frustrated, anxious, decision fatigue After : Contented	<b>10. YOUR SOLUTION</b> <span>SL</span> • The platform is based on helping a customer without any drawbacks to products • Full-time accessible source • It remains us whenever mega sales and festival offers • Trustable platform • It solves any queries about any bugs and errors during payment or purchase	<b>8. CHANNELS of BEHAVIOR</b> <span>CH</span> ONLINE • Social Media • Websites OFFLINE • Shops • Whole sale dealer Extract online & offline CH of BE

Fig 3.4 Problem Solution fit

## **CHAPTER 4**

### **REQUIREMENT ANALYSIS**

Requirements analysis is very critical process that enables the success of a system or software project to be assessed. Requirements are generally split into two types: Functional and Non-functional requirements.

#### **4.1 FUNCTIONAL REQUIREMENTS**

These are the requirements that the end user specifically demands as basic facilities that the system should offer. All these functionalities need to be necessarily incorporated into the system as a part of the contract. These are represented or stated in the form of input to be given to the system, the operation performed and the output expected. They are basically the requirements stated by the user which one can see directly in the final product, unlike the non-functional requirements. The below table 4.1 shows the Functional Requirements for the cloud Based Inventory management System

<b>FR No.</b>	<b>Functional Requirement (EPIC)</b>	<b>Sub Requirement (Story/ Sub Task)</b>
FR-1	User Registration	Registration using Business e-mail
FR-2	User Confirmation	Confirmation Via Email Confirmation Via OTP
FR-3	Account Completion	Filling the details required to maintain an inventory
FR-4	Allocating hub manager	Providing restricted access to the hub managers to maintain entire hub's in a single logic using access policy
FR-5	Analysis of demand/ stock moment	Regular communication regarding stock moment to the user. Using sendgrid mail service and also using IBM Watson Ai chat Bot

**Table 4.1 Functional Requirements for the cloud Based Inventory management System**

## 4.2 NON-FUNCTIONAL REQUIREMENTS

These are basically the quality constraints that the system must satisfy according to the project contract. The priority or extent to which these factors are implemented varies from one project to other. They are also called non-behavioral requirements. The below table 4.2 shows the Non-Functional Requirements for the cloud Based Inventory management System

<b>FR No.</b>	<b>Non-Functional Requirement</b>	<b>Description</b>
NFR-1	<b>Usability</b>	It avoids manual entry so mistakes can be avoided and it also gives us regular notification about the stock moment because of that we can be able to maintain inventory in an efficient way.
NFR- 2	<b>Security</b>	Here we are providing two step authentications to provide a better security as well the owner of the account has full access to them accounts he/she can restrict other user this will provide better security because each and every action will be monitored.
NFR- 3	<b>Reliability</b>	The product is going to be developed in microservice architecture so the complexity of the software will be reduced and it will improve the performance. each and every module will be loosely coupled so failure of one module will not lead to failure of entire system.
NFR- 4	<b>Performance</b>	Hence, we are going to develop the product in microservice architecture each and every module is going to have their own environment so traffic in one module will not affect other.

**Table 4.2 Non-Functional Requirements of cloud-based Inventory management System**

## **CHAPTER 5**

### **PROJECT DESIGN**

#### **5.1 DATA FLOW DIAGRAMS**

A data flow diagram (DFD) maps out the flow of information for any process or system. It uses defined symbols like rectangles, circles and arrows, plus short text labels, to show data inputs, outputs, storage points and the routes between each destination. Data flowcharts can range from simple, even hand-drawn process overviews, to in-depth, multi-level DFDs that dig progressively deeper into how the data is handled. They can be used to analyze an existing system or model a new one. Like all the best diagrams and charts, a DFD can often visually “say” things that would be hard to explain in words, and they work for both technical and nontechnical audiences, from developer to CEO. That’s why DFDs remain so popular after all these years. While they work well for data flow software and systems, they are less applicable nowadays to visualizing interactive, real-time or database-oriented software or systems.

There are four main elements of a DFD — external entity, process, data store, and data flow.

- **External entity**

An external entity, which are also known as terminators, sources, sinks, or actors, are an outside system or process that sends or receives data to and from the diagrammed system. They’re either the sources or destinations of information, so they’re usually placed on the diagram’s edges. External entity symbols are similar across models except for Unified, which uses a stick-figure drawing instead of a rectangle, circle, or square.

- **Process**

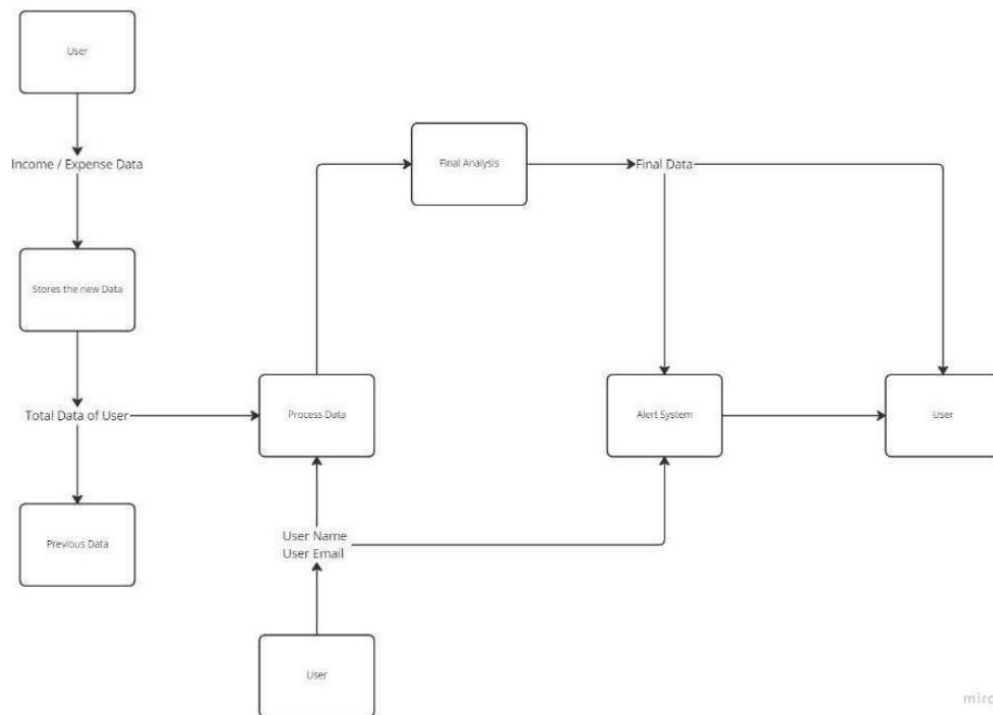

Process is a procedure that manipulates the data and its flow by taking incoming data, changing it, and producing an output with it. A process can do this by performing computations and using logic to sort the data, or change its flow of direction. Processes usually start from the top left of the DFD and finish on the bottom right of the diagram.

- **Data store**

Data stores hold information for later use, like a file of documents that's waiting to be processed. Data inputs flow through a process and then through a data store while data outputs flow out of a data store and then through a process.

- **Data flow**

Data flow is the path the system's information takes from external entities through processes and data stores. With arrows and succinct labels, the DFD can show the direction of the data flow. The below Fig 5.1 shows the Data Flow Diagram for Inventory Management system for retailers

**Fig 5.1: Data Flow Diagram for Inventory Management system for retailers**

## 5.2 SOLUTION AND TECHNICAL ARCHITECHTURE

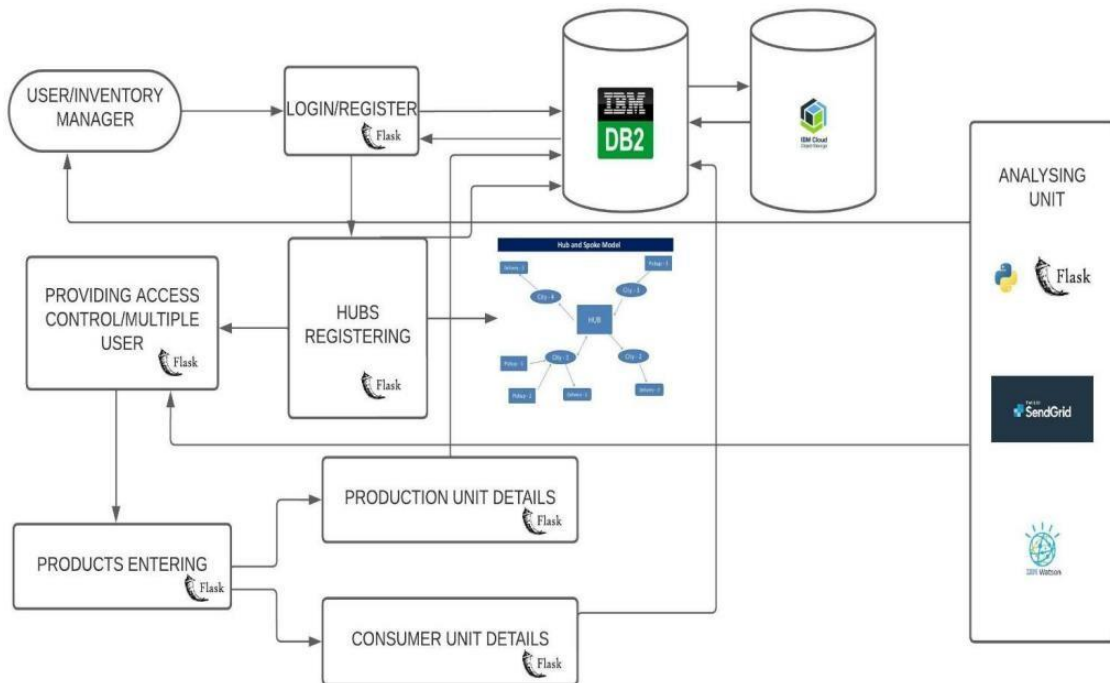

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behaviour, and other aspects of the software to project stakeholders.

- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

The below figure 5.2 shows the Solution architecture of Inventory Management for retailers

**Fig 5.2: Solution architecture of Inventory Management for retailers**

**CHAPTER 6**  
**PROJECT PLANNING & SCHEDULING**

**6.1 SPRINT PLANNING AND ESTIMATION**

Sprint planning is an event in scrum that kicks off the sprint. The purpose of sprint planning is to define what can be delivered in the sprint and how that work will be achieved. Sprint planning is done in collaboration with the whole scrum team.

The sprint is a set period of time where all the work is done. However, before leap into action it is necessary to set up the sprint. It needs to decide on how long the time box is going to be, the sprint goal, and where it is going to start. The sprint planning session kicks off the sprint by setting the agenda and focus. If done correctly, it also creates an environment where the team is motivated, challenged, and can be successful. The below table 6.1 shows the Sprint Planning and estimation for Inventory Management system for Retailers

<b>SPRINT</b>	<b>FUNCTIONAL REQUIREMENT</b>	<b>USER STORY NUMBER</b>	<b>USER STORY / TASK</b>	<b>STORY POINTS</b>	<b>PRIORITY</b>
Sprint-1	Registration	USN-1	As a user, I can register for the application by using my email & password and confirming my login credentials.	3	High
Sprint-1	Confirmation	USN-3	As a user, I can receive my confirmation email once I have registered for the application.	2	High
Sprint-1	Login	USN-4	As a user, I can log in to the authorized account by entering the registered email and password.	3	Medium

Sprint-2	Dashboard	USN-5	As a user, I can view the products that are available currently.	4	High
Sprint-2	Stocks update	USN-6	As a user, I can add products which are not available in the inventory and restock the products.	3	Medium
Sprint-3	Sales prediction	USN-7	As a user, I can get access to sales prediction tool which can help me to predict better restock management of product.	6	Medium
Sprint-4	Request for customer care	USN-8	As a user, I am able to request customer care to get in touch with the administrators and enquire the doubts and problems.	4	Medium
Sprint-4	Giving feedback	USN-9	As a user, I am able to send feedback forms reporting any ideas for improving or resolving any issues I am facing to get it resolved.	3	Medium

**Table 6.1: Sprint Planning and estimation for Inventory Management system for Retailers**

## 6.2 SPRINT DELIVERY SCHEDULE

The sprint delivery plan is scheduled accordingly as shown in the below table 6.2 which consists of the sprints with respective to their duration, sprint start and end date and the releasing data

<b>SPRINT</b>	<b>TOTAL STORY POINTS</b>	<b>DURATION</b>	<b>SPRINT START DATE</b>	<b>SPRINT END DATE (PLANNED)</b>	<b>STORY POINTS COMPLETED (AS ON PLANNED END DATE)</b>	<b>SPRINT RELEASE DATE (ACTUAL)</b>
Sprint-1	11	6 Days	24 Oct 2022	29 Oct 2022	11	29 Oct 2022
Sprint-2	7	6 Days	31 Oct 2022	05 Nov 2022	7	05 Nov 2022
Sprint-3	6	6 Days	07 Nov 2022	12 Nov 2022	6	12 Nov 2022
Sprint-4	7	6 Days	14 Nov 2022	19 Nov 2022	7	19 Nov 2022

**Table 6.2: Sprint Planning done for Inventory Management system for Retailers**

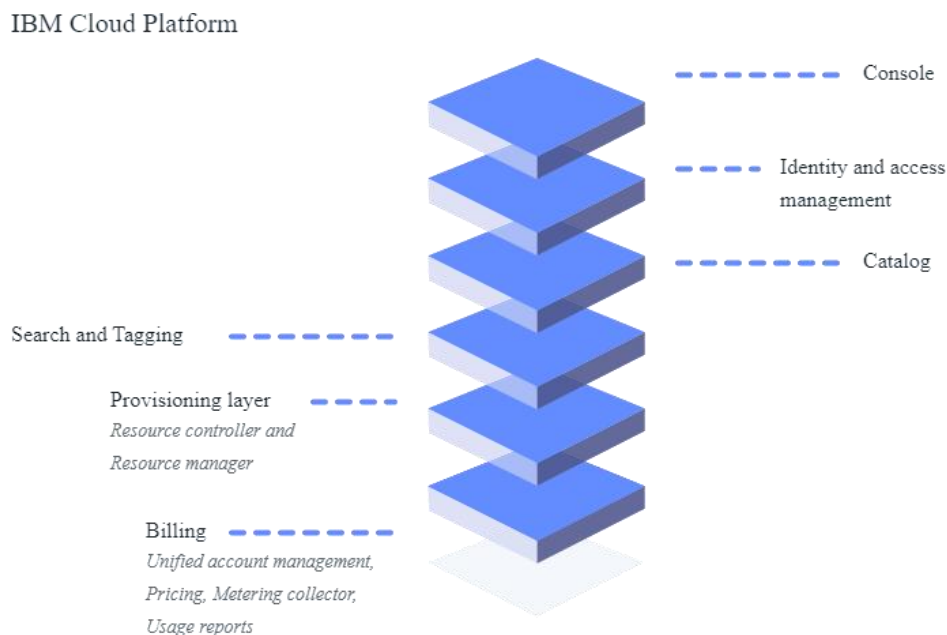

## **CHAPTER 7**

### **CODING & SOLUTIONING**

#### **7.1 IBM Cloud**

The IBM Cloud platform combines platform as a service (PaaS) with infrastructure as a service (IaaS) to provide an integrated experience. The platform scales and supports both small development teams and organizations, and large enterprise businesses. Globally deployed across data centers around the world, the solution you build on IBM Cloud spins up fast and performs reliably in a tested and supported environment you can trust!

IBM Cloud provides solutions that enable higher levels of compliance, security, and management, with proven architecture patterns and methods for rapid delivery for running mission-critical workloads.

**Fig 7.1: IBM cloud platform**

#### **7.2 Flask framework**

Flask is a micro web framework written in Python. It is classified as a microframework because it does not require particular tools or libraries. It has no database abstraction layer, form validation, or any other components where pre-existing third-party libraries provide common functions. However, Flask supports extensions that can add application features as if they were implemented in Flask itself. Extensions exist

for object-relational mappers, form validation, upload handling, various open authentication technologies and several common framework related tools.

### 7.3 IBM DB2 Module

Module features allow you to

- Extend schema support by allowing you to group together, in a named set, a collection of related data type definitions, database object definitions and other logic elements including:
  - SQL procedures
  - A module initialization procedure for implicit execution upon module initialization
  - User-defined data type definitions including: distinct type, array type, associative array type, row type, and cursor type
- Define a namespace such that objects defined within the module can refer to other objects defined in the module without providing an explicit qualifier.
- Add object definitions that are private to the module. These objects can only be referenced by other objects within the module.
- Add object definitions that are published. Published objects can be referenced from within the module or from outside of the module.
- Define published prototypes of routines without routine-bodies in modules and later implement the routine-bodies using the routine prototype.
- Initialize the module by executing the module initialization procedure for the module. This procedure can include SQL statements, SQL PL statements, and can be used to set default values for global variables or to open cursors.
- Reference objects defined in the module from within the module and from outside of the module by using the module name as a qualifier (2-part name support) or a combination of the module name and schema name as qualifiers (3-part name support).
- Drop objects defined within the module.
- Drop the module.
- Manage who can reference objects in a module by allowing you to grant and revoke the EXECUTE privilege for the module.

## **7.4 Docker CLI**

The Docker client enables users to interact with Docker. The Docker client can reside on the same host as the daemon or connect to a daemon on a remote host. A docker client can communicate with more than one daemon. The Docker client provides a command line interface (CLI) that allows you to issue build, run, and stop application commands to a Docker daemon. The main purpose of the Docker Client is to provide a means to direct the pull of images from a registry and to have it run on a Docker host. Common commands issued by a client are:

- docker build
- docker pull
- docker run

## **7.5 IBM cloud CLI**

IBM Cloud CLI provides full management of your IBM Cloud account via command line. Some installation steps described along this guide may need the IBM Cloud Command Line Interface (CLI) available to be performed.

## **7.6 SendGrid API**

SendGrid's web API allows users to pull information about their email program without having to actually log on to SendGrid.com. Users can pull lists, statistics, and even email reports. In addition to this, users can send email via the web API without using traditional SMTP.

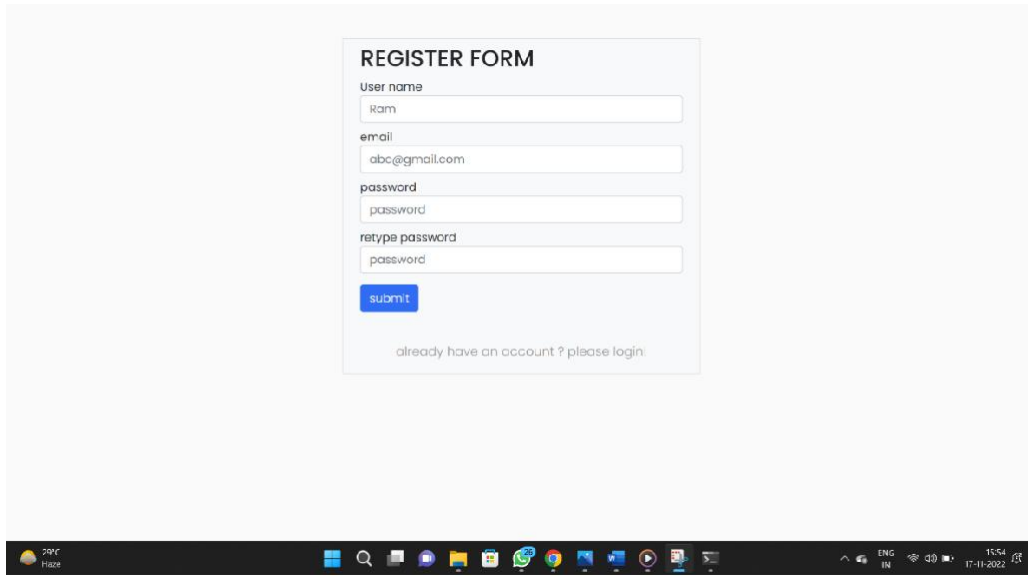

## **7.7 Kubernetes**

Kubernetes is an open-source Container Management tool which automates container deployment, container scaling, and descaling and container load balancing (also called as container orchestration tool). It is written in Golang and has a huge community because it was first developed by Google and later donated to CNCF (Cloud Native Computing Foundation). Kubernetes can group 'n' number of containers into one logical unit for managing and deploying them easily. It works brilliantly with all cloud vendors i.e. public, hybrid and on-premises. Kubernetes is an open-source platform that manages Docker containers in the form of a cluster. Along with the automated deployment and scaling of containers, it provides healing by automatically restarting failed containers and rescheduling them when their hosts die. This capability improves the application's availability.

## **CHAPTER 8**

### **TESTING AND RESULTS**

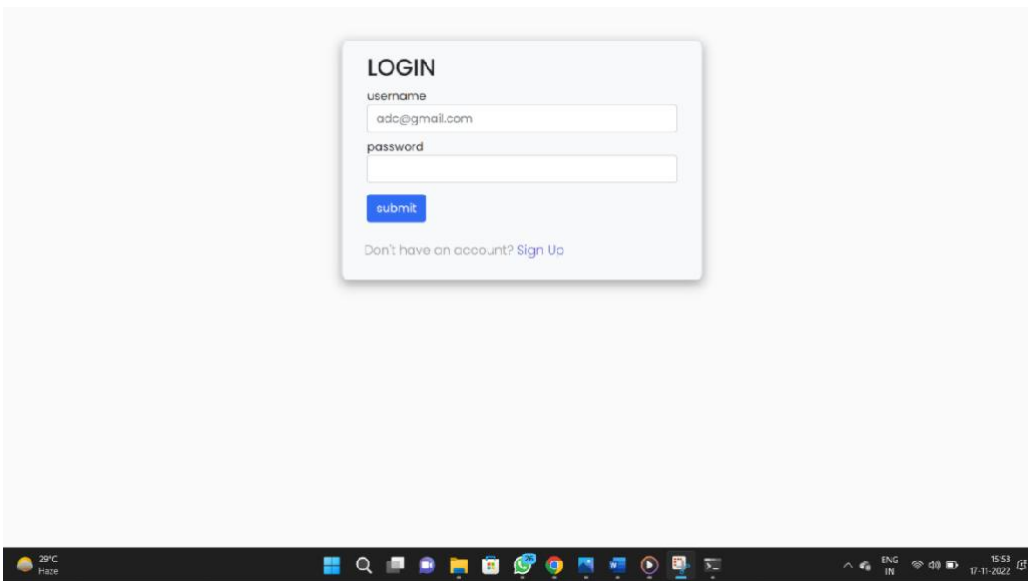

This Chapter presents the results the results of Inventory Management System for Retailers. The below Fig 8.1 shows the Sign-Up page for Inventory Management System for Retailers

The screenshot displays a web browser window with a 'REGISTER FORM' centered on the page. The form includes the following fields: 'User name' with the value 'Ram', 'email' with the value 'abc@gmail.com', 'password' with the value 'password', and 'retype password' with the value 'password'. A blue 'submit' button is located below the password fields. At the bottom of the form, there is a link that reads 'already have an account ? please login'. The browser's taskbar at the bottom shows the system clock as 15:54 on 17-11-2022, along with various application icons and system status indicators.

**Fig 8.1: Sign Up page for Inventory Management System for Retailers**

The below Fig 8.2 shows the Login Page for Inventory Management System for Retailers

The screenshot shows a web browser window with a 'LOGIN' form centered on the page. The form contains two input fields: 'username' with the value 'abc@gmail.com' and 'password'. A blue 'submit' button is positioned below the password field. At the bottom of the form, there is a link that reads 'Don't have an account? Sign Up'. The browser's taskbar at the bottom shows the system clock as 15:53 on 17-11-2022, along with various application icons and system status indicators.

## CHAPTER 9

### PERFORMANCE RESULTS

#### 9.1 PERFORMANCE METRICS

Fig 9.1 shows the performance metrics of the flask application using Google Developer Tools.

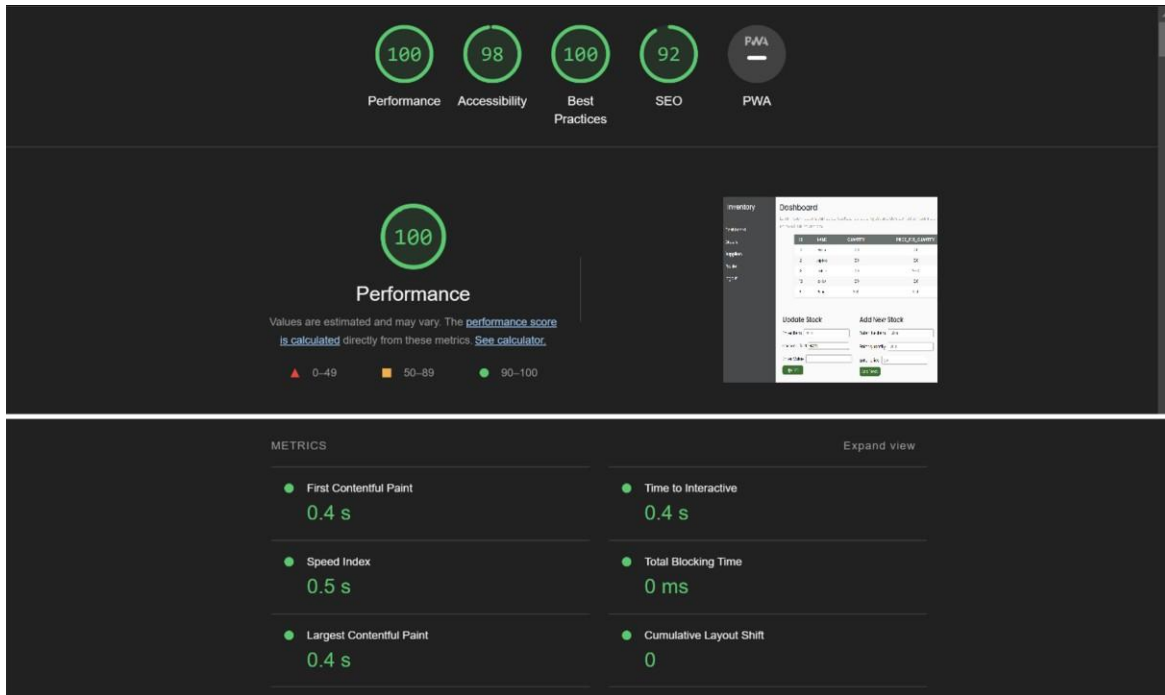

Fig 9.1: Performance metrics

## **CHAPTER 10**

### **ADVANTAGES AND DISADVANTAGES**

#### **10.1 ADVANTAGES**

The inventory management system for retailers is a web-based application. A dashboard is given to retailers where they can able to update, manage and create a product and assign the number of quantities for the products. Whenever a product goes out of stock the inventory management system for retailers alerts the retailers through email stating product goes out of stocks. Thus, inventory management system helps retailers to increase the profit and reduce the risk of holding large quantity of a particular stock. The inventory management system helps the retailers to efficiently utilizes the inventory area i.e., where the store all the products

#### **10.2 DISADVANTAGES**

The inventory management system for retailers helps them in many ways, but it needs a manual way of updating the quantity of the product. The retailers need to create and update the quantity of stock in the web-based application. The inventory management system necessitates manual updating of stock quantities, which adds to their workload.

## **CHAPTER 11**

### **CONCLUSION**

A web-based application is created to manage inventory stocks. Retailers can able to update, create, and manage products in this web application.

The inventory management system gives a mail alert, if a product goes out of stock, stating that a product has gone out of stock.

This allows retailers to increase their profit, reduce the risk of having too much stock, and make better use of their inventory space.

## **CHAPTER 12**

### **FUTURE SCOPE**

The future scope of the web-based inventory management application for retailers includes building a charting system into the application that helps them know the sales performance of a product for different time periods like a day, a week, or a year.

Automation of updating the quantity of stock for each product using technologies like barcodes, QR codes, etc.

Analyze each product's sales performance in relation to key performance indicators to determine when to offer discounts and offers on products with good and bad stock performance.
